Advanced PDF Workflow Activities for Laserfiche®

Laserfiche Workflow has extensive functionality allowing users to automate tasks within the Laserfiche Document Management repository. CDI has developed additional, custom workflow activities that extend the ability of Laserfiche Workflow. These Workflow Activities may be licensed and added to your Workflow Designer in a bundle.

Custom CDI Workflow Activities

Add PDF Fields

This activity adds one or more fillable fields to a PDF document. Field types include Signature, Text, Multi-line, and Password. The updated PDF can then be used in subsequent Workflow activities, such as saving to the repository, emailing as an attachment, exporting to a network share, etc.

Generate PDF Pages

The Generate PDF Pages workflow activity generates a TIFF image of the PDF documents within Laserfiche. This is useful because users are then able to take advantage of native Laserfiche functionality such as annotations, sticky notes, stamps and redaction.

Populate PDF Images

This activity adds onto the existing *Fill Out PDF Form* from Laserfiche and allows you to dynamically add images to a PDF.

Print PDF

This activity sends a PDF to a printer. This allows users to approve a document and automatically send it for printing.
